

# Securing Mobile Networks

---

An Enabling Technology for  
National and International  
Security and Beyond

# Goals for November 6th

---

- Highlight Mobile Networking Technology
  - Emphasizing National and International Security today due to time limitations.
- Discuss security policy
  - Enabling shared infrastructure (when reasonable)
- Next Steps (Afternoon Session)
- Other Items (Afternoon Session)

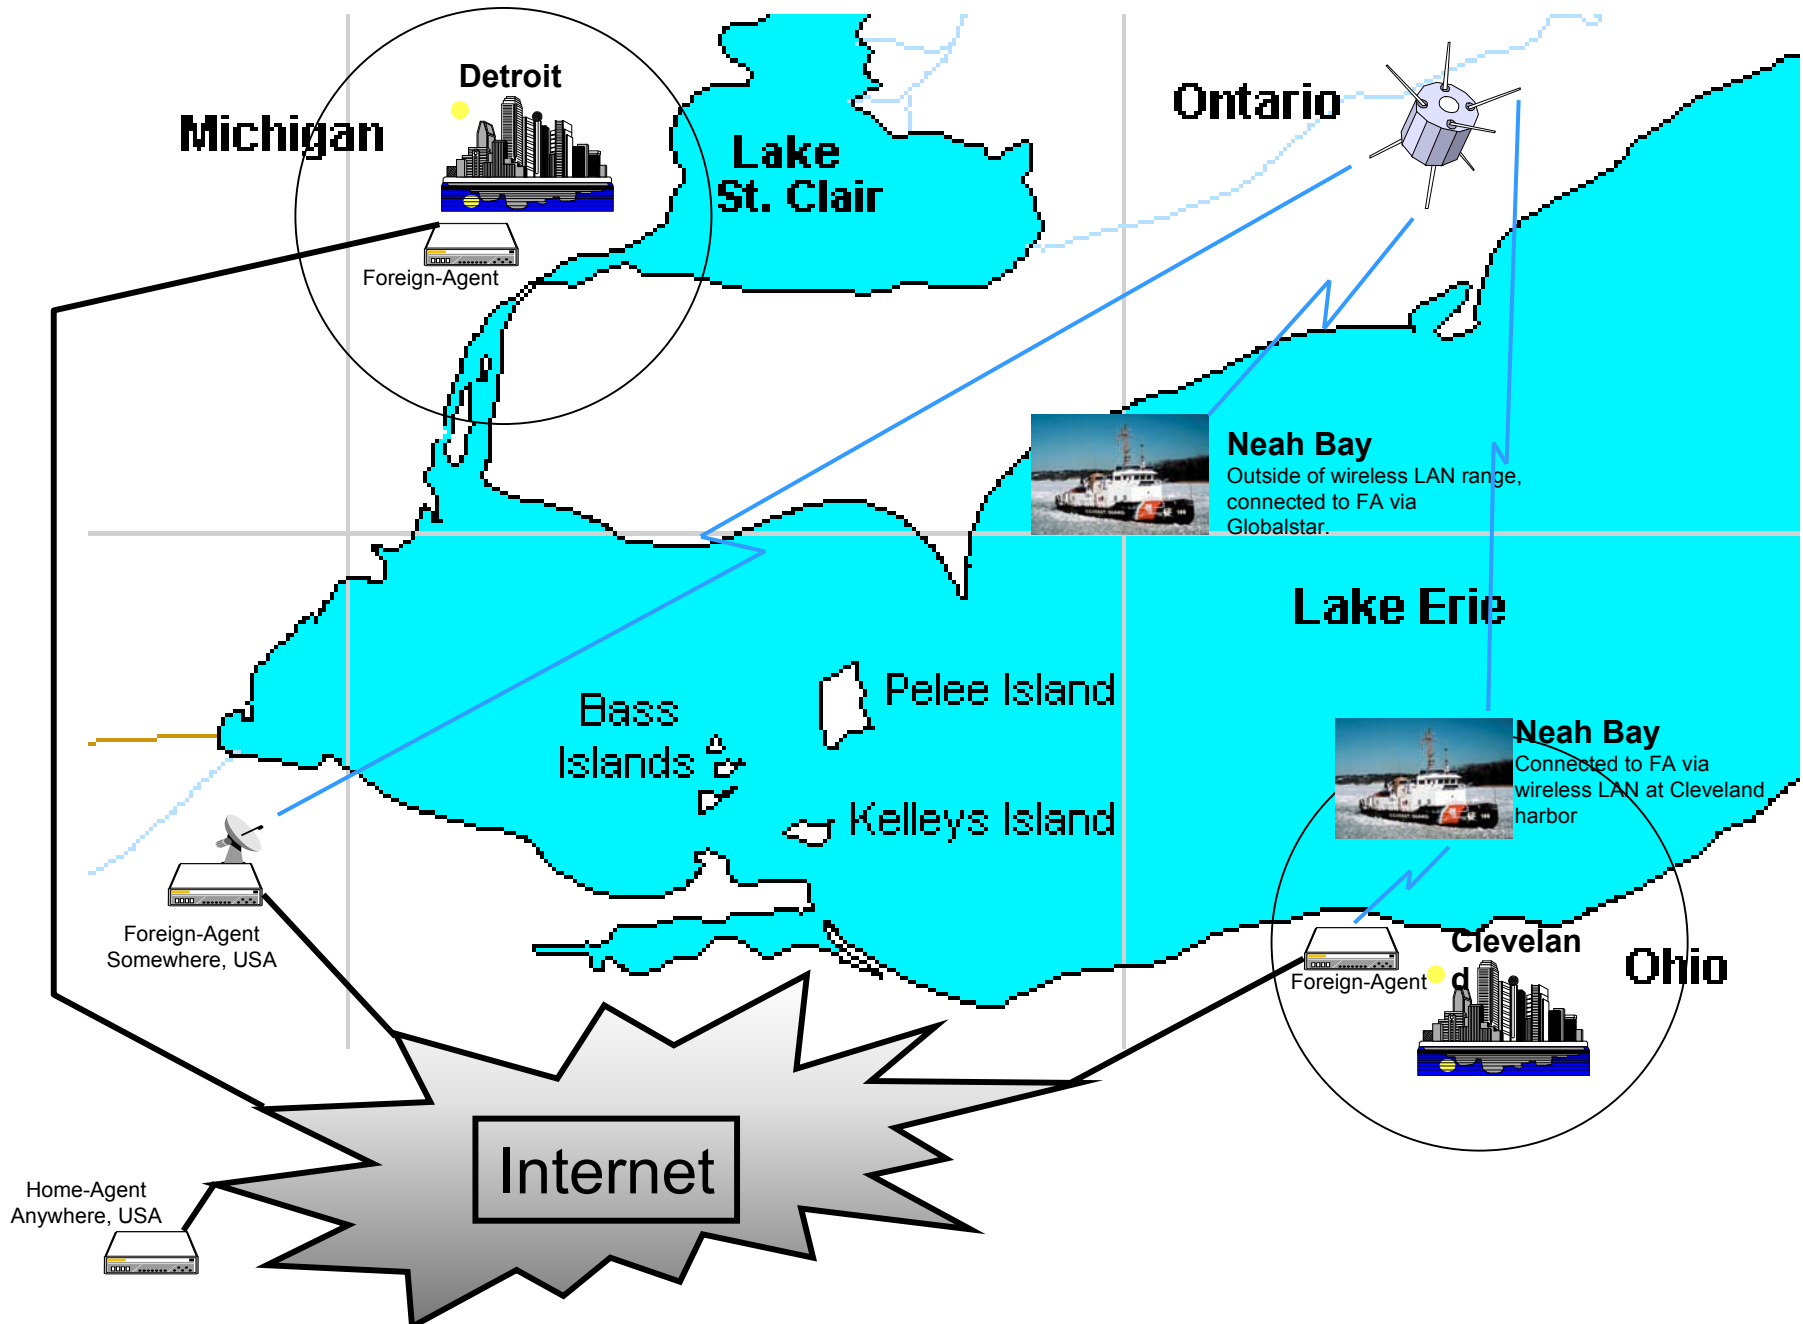

# Today's Audience

---

- Big Picture People
- Policy Makers
- Media
- Code Writers
- Implementers

Please, don't be afraid to ask questions.

# Neah Bay / Mobile Router Project

# Why NASA/USCG/Industry

---

- Real world deployment issues can only be addressed in an operational network.
- USCG has immediate needs, therefore willingness to work the problem.
- USCG has military network requirements.
- USCG is large enough network to force us to investigate full scale deployment issues
- USCG is small enough to work with.
- NASA has same network issues regarding mobility, security, network management and scalability.

# Mobile-Router Advantages

---

- Share wireless and network resources with other organizations
  - \$\$\$ savings
- Set and forget
  - No onsite expertise required
  - However, you still have to engineer the network
- Continuous Connectivity
  - (May or may not be important to your organization)
- Robust
  - Secondary Home Agent (Reparenting of HA)

# Mobile Network Design Goals

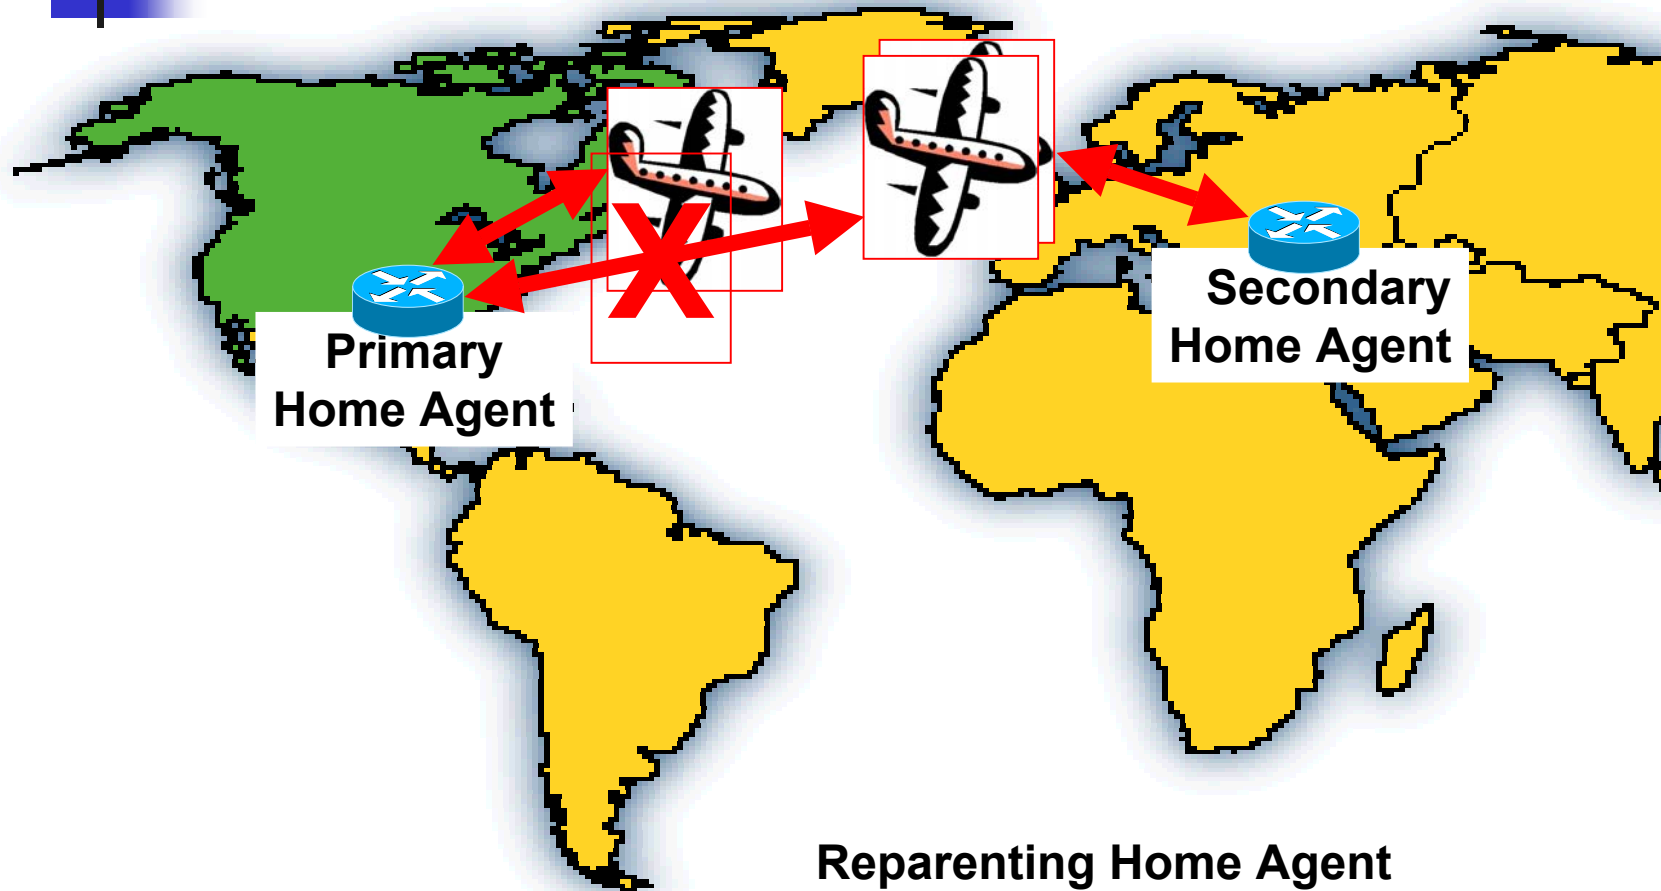

---

- Secure
- Scalable
- Manageable
- Ability to sharing network infrastructure
- Robust

# Secondary Home Agent (reparenting the HA)

**Reparenting Home Agent  
Helps resolve triangular routing  
Problem over long distances**

# Emergency Backup (Hub / Spoke Network)

If primary control site becomes physically inaccessible but can be electronically connected, a secondary site can be established.

If primary control site is physically incapacitated, there is no backup capability.

# Secondary Home Agent (Fully Meshed Network)

If primary control site is physically incapacitated, a second or third or fourth site take over automatically.

# We Are Running with Reverse Tunneling

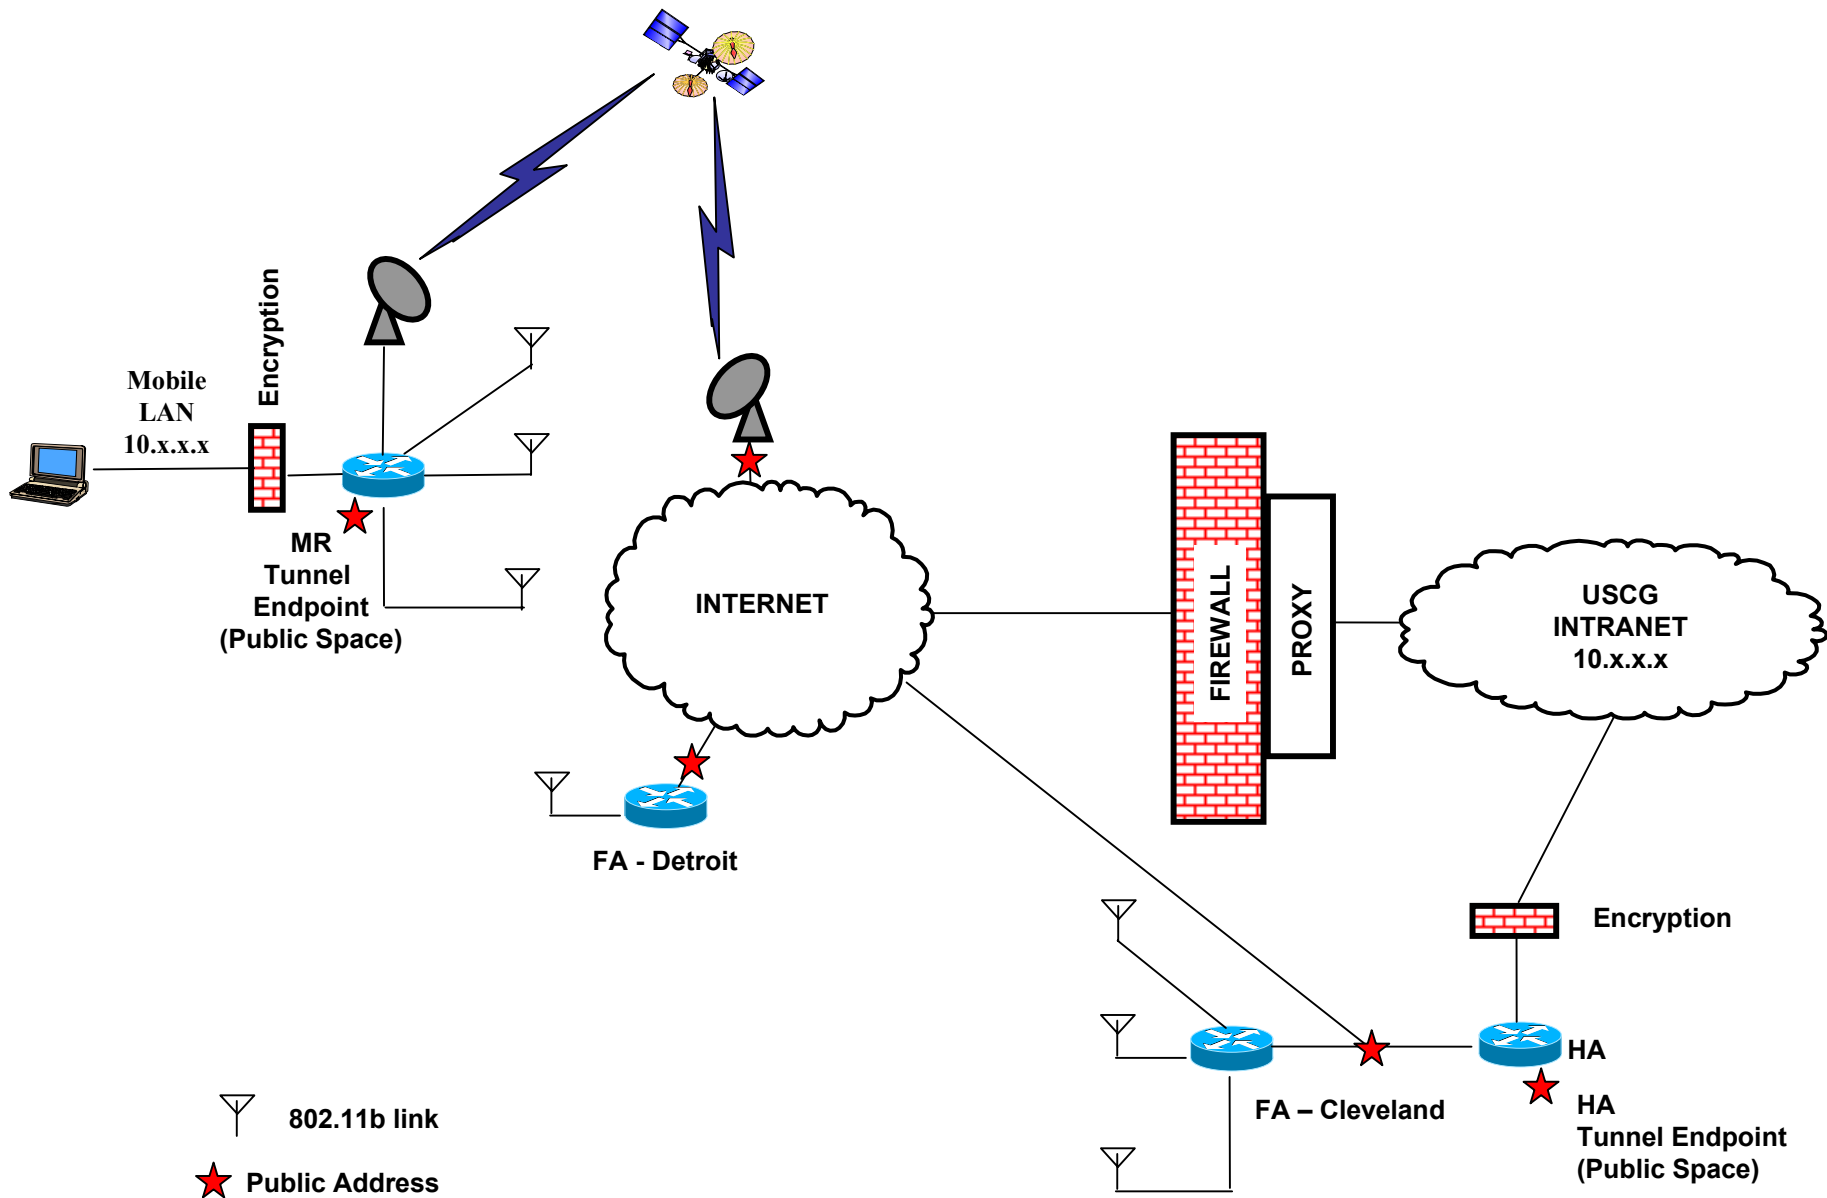

---

## ■ Pros

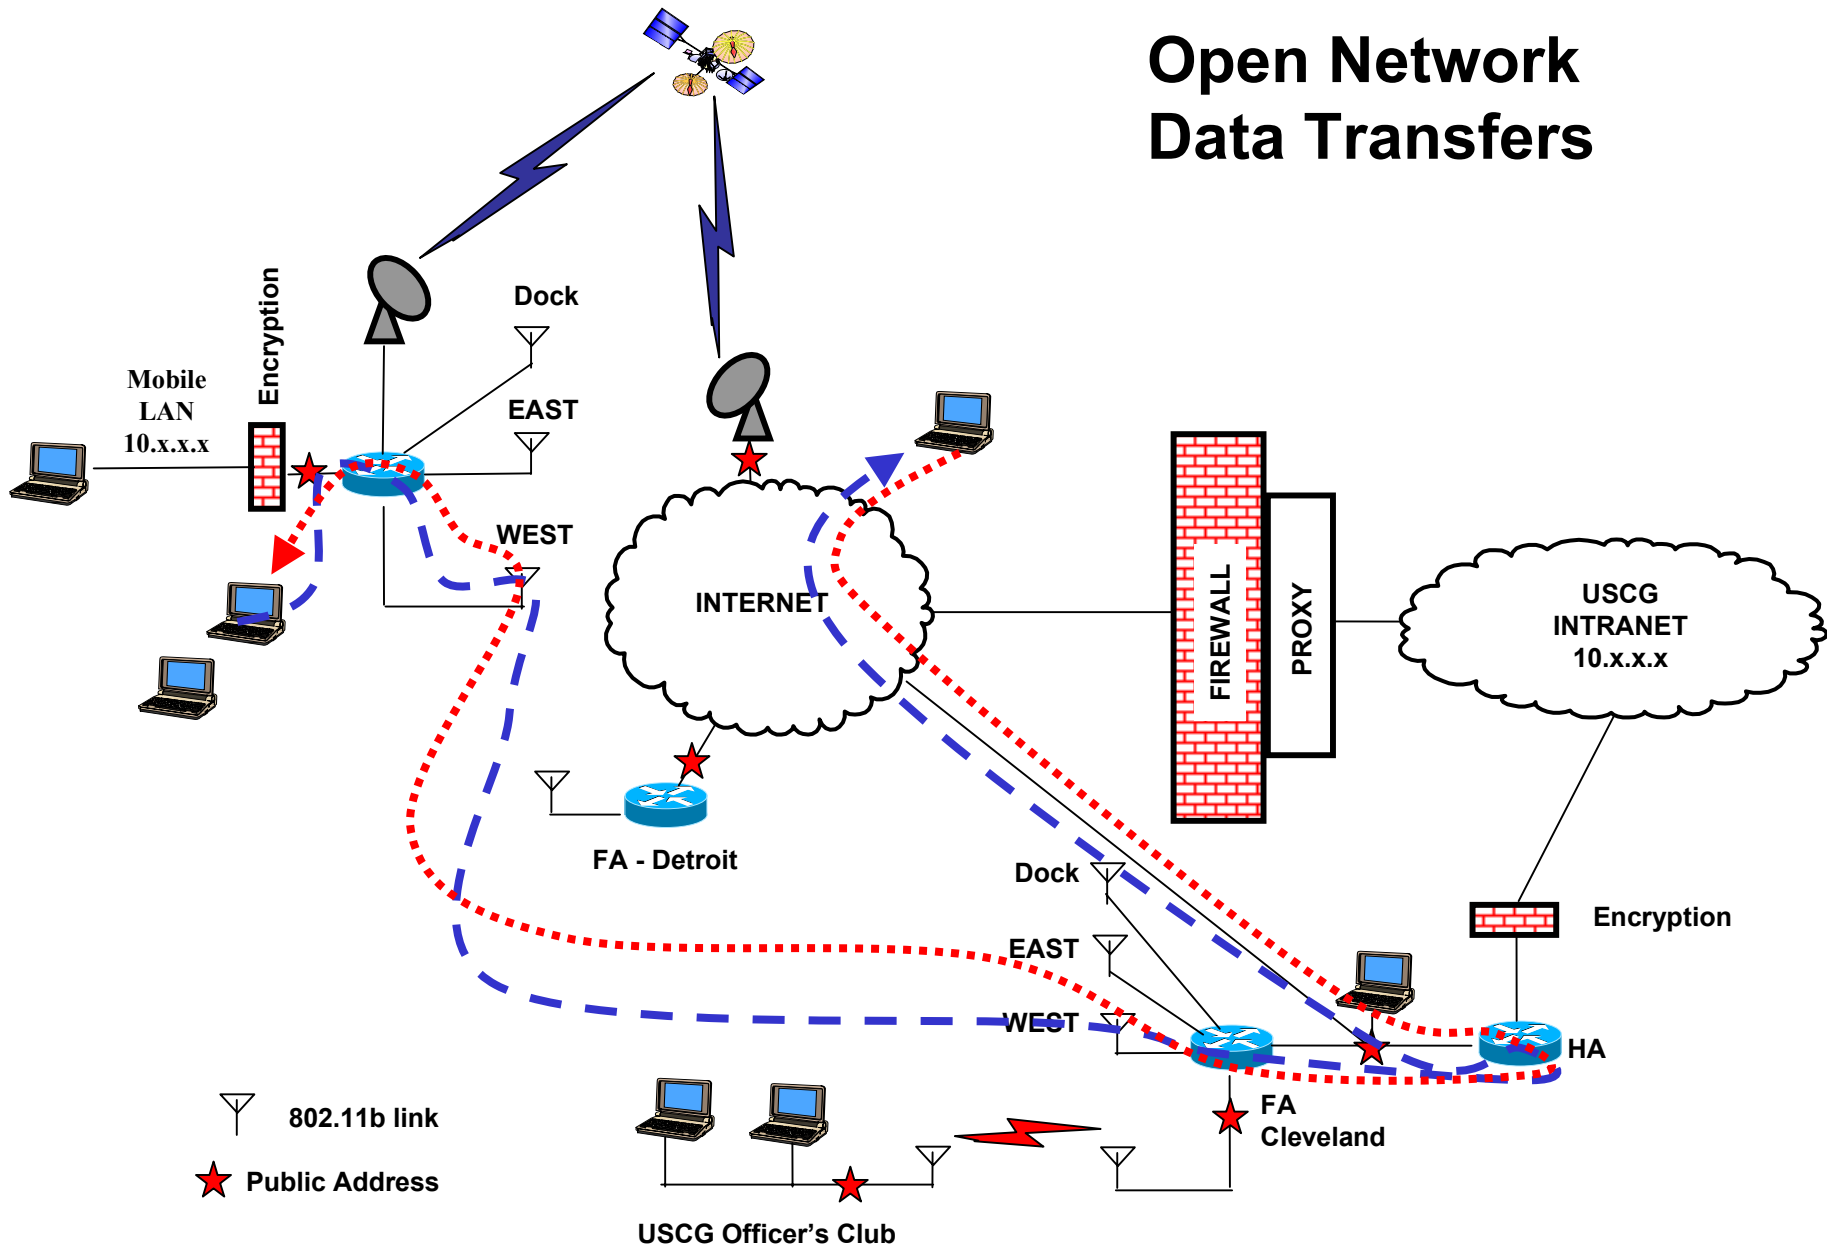

- Ensures topologically correct addresses on foreign networks
- Required as requests from MR LAN hosts must pass through Proxy inside main firewall
- Greatly simplifies setup and management of security associations in encryptors
- Greatly simplifies multicast – HA makes for an excellent rendezvous point.

## ■ Cons

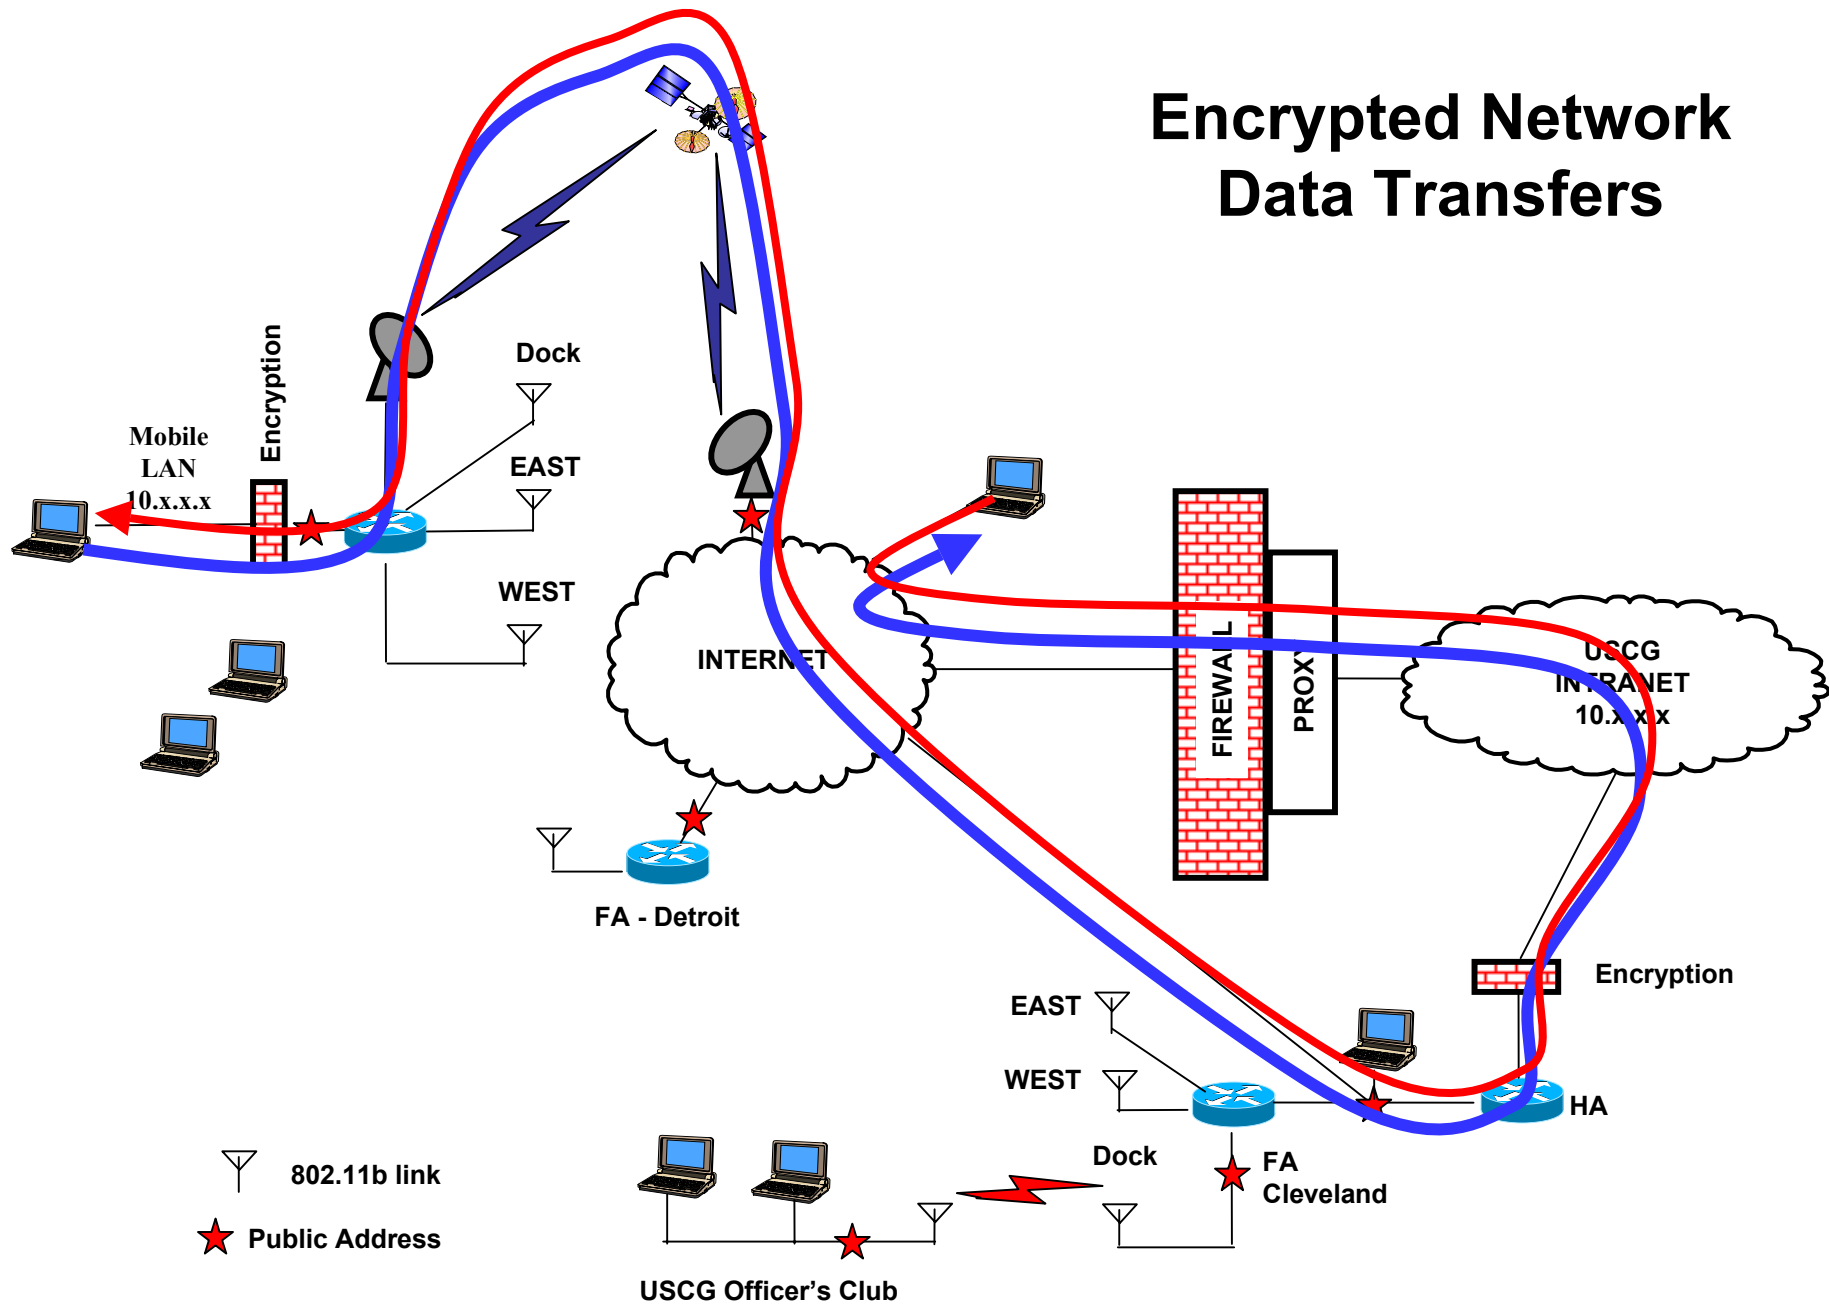

- Uses additional bandwidth
- Destroys route optimization

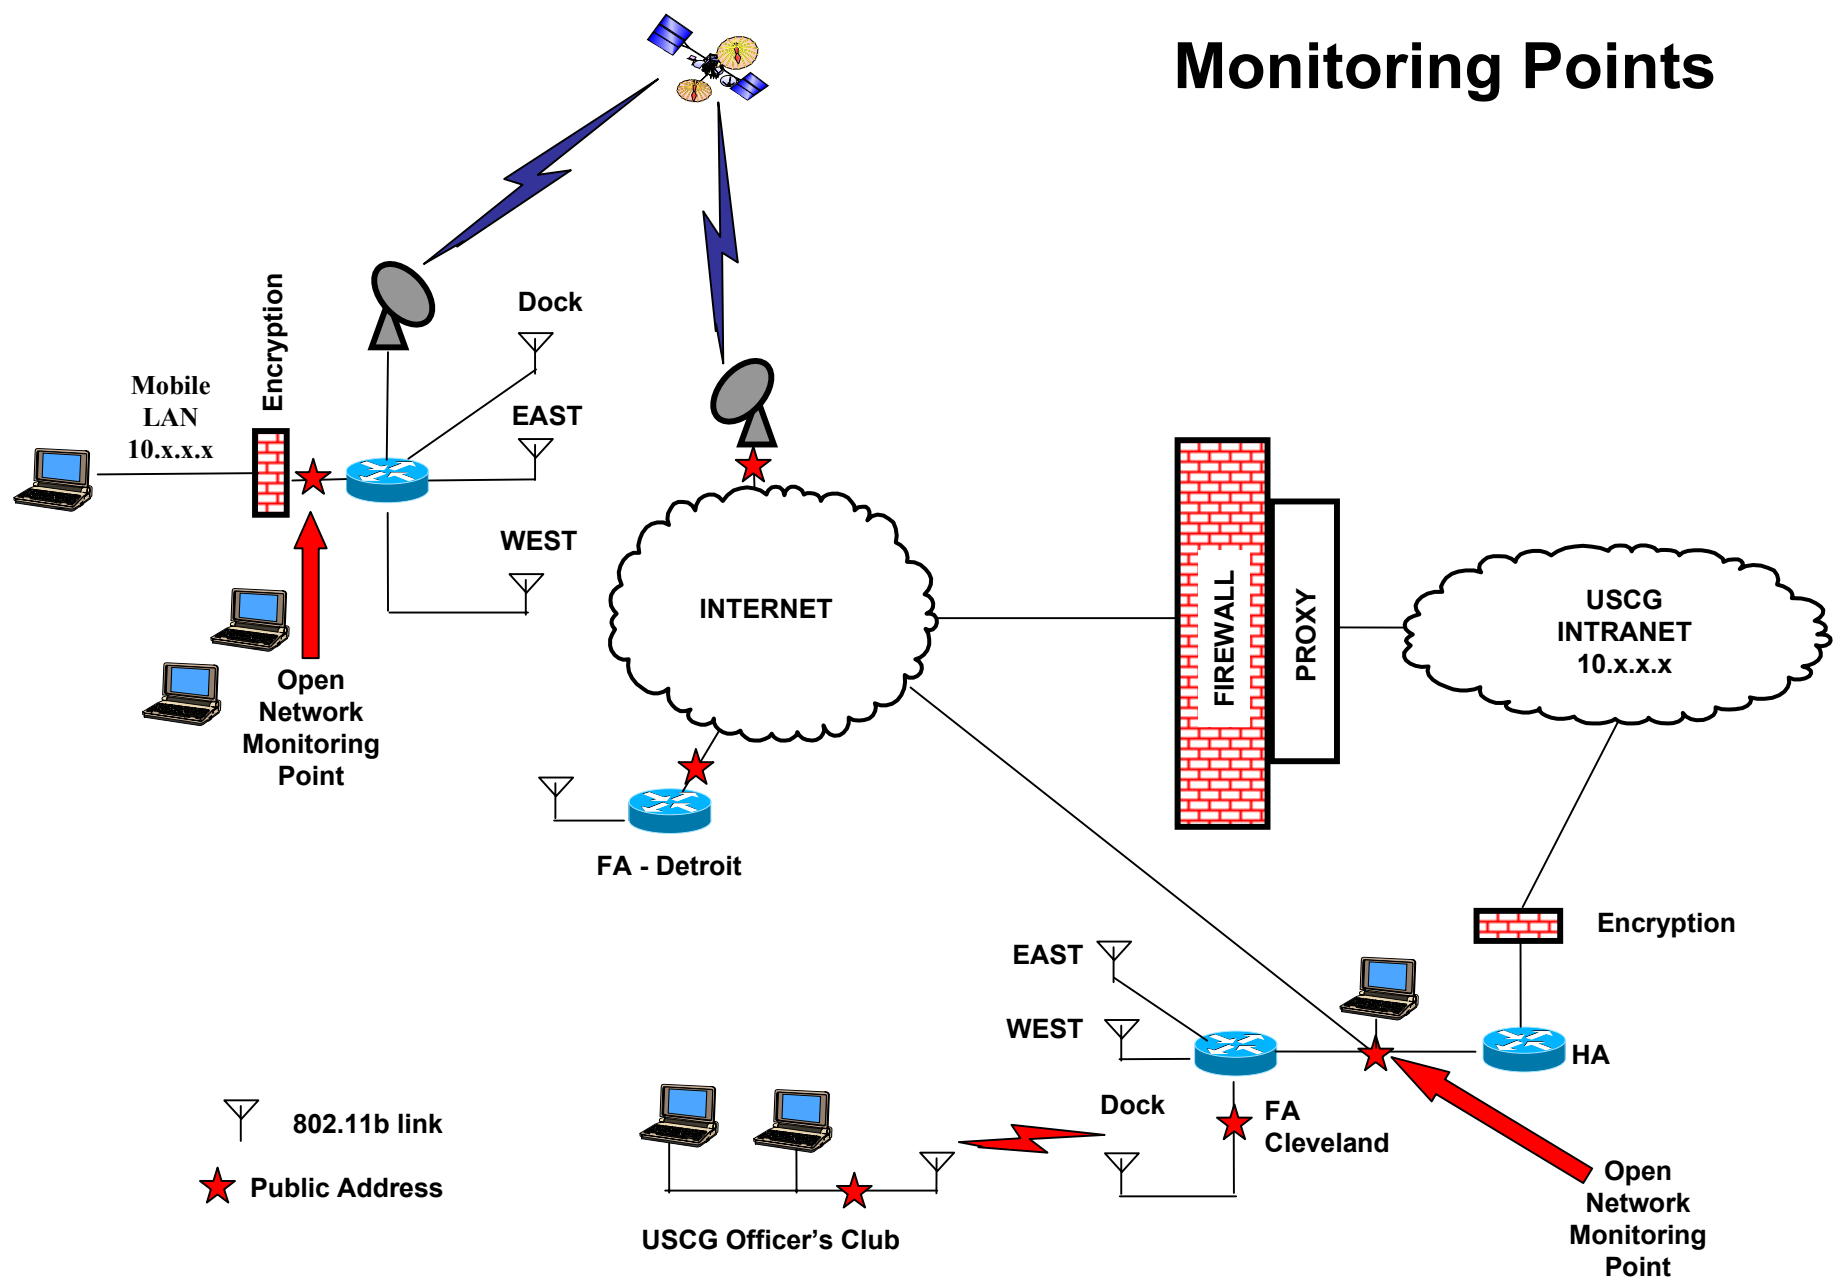

# Open Network Data Transfers

# Encrypted Network Data Transfers

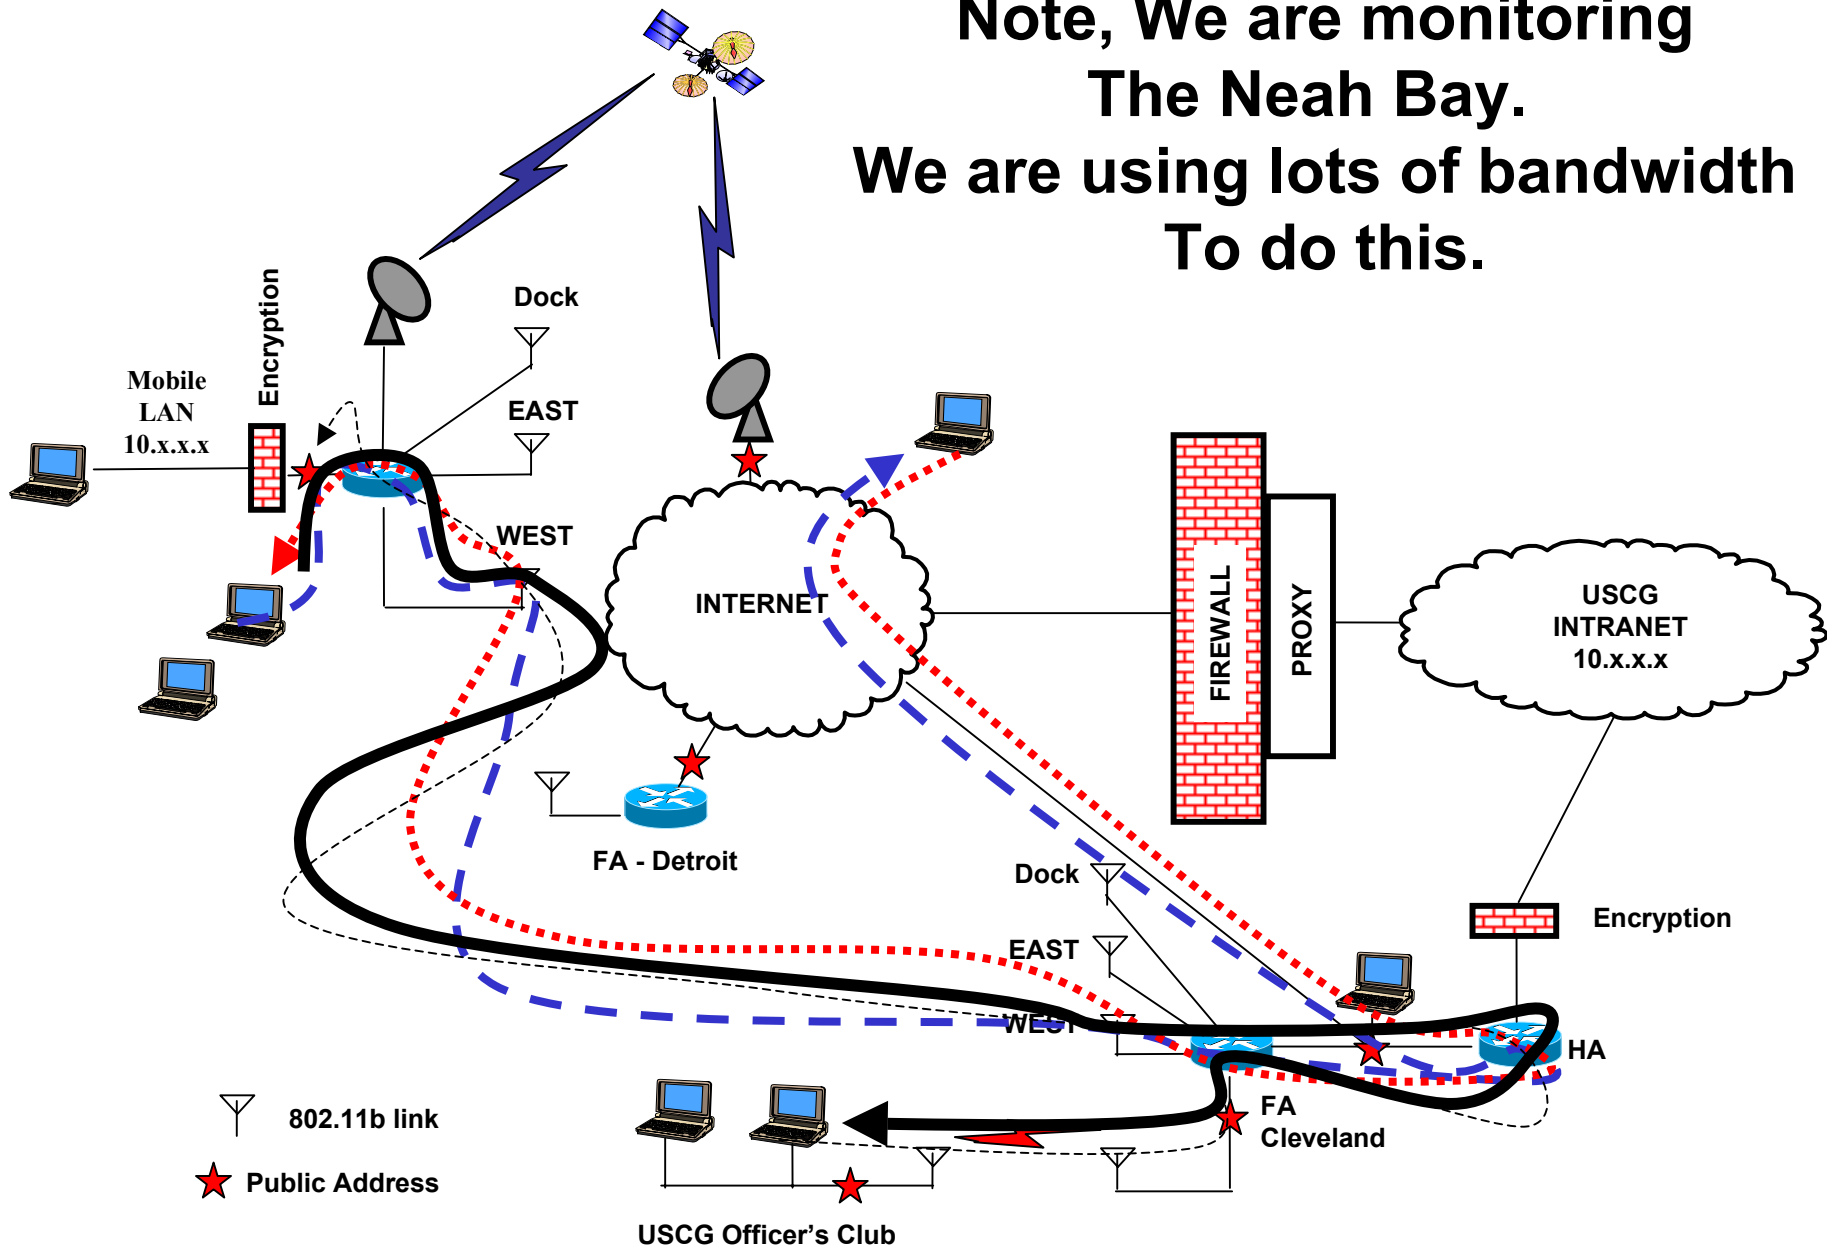

# Monitoring Points

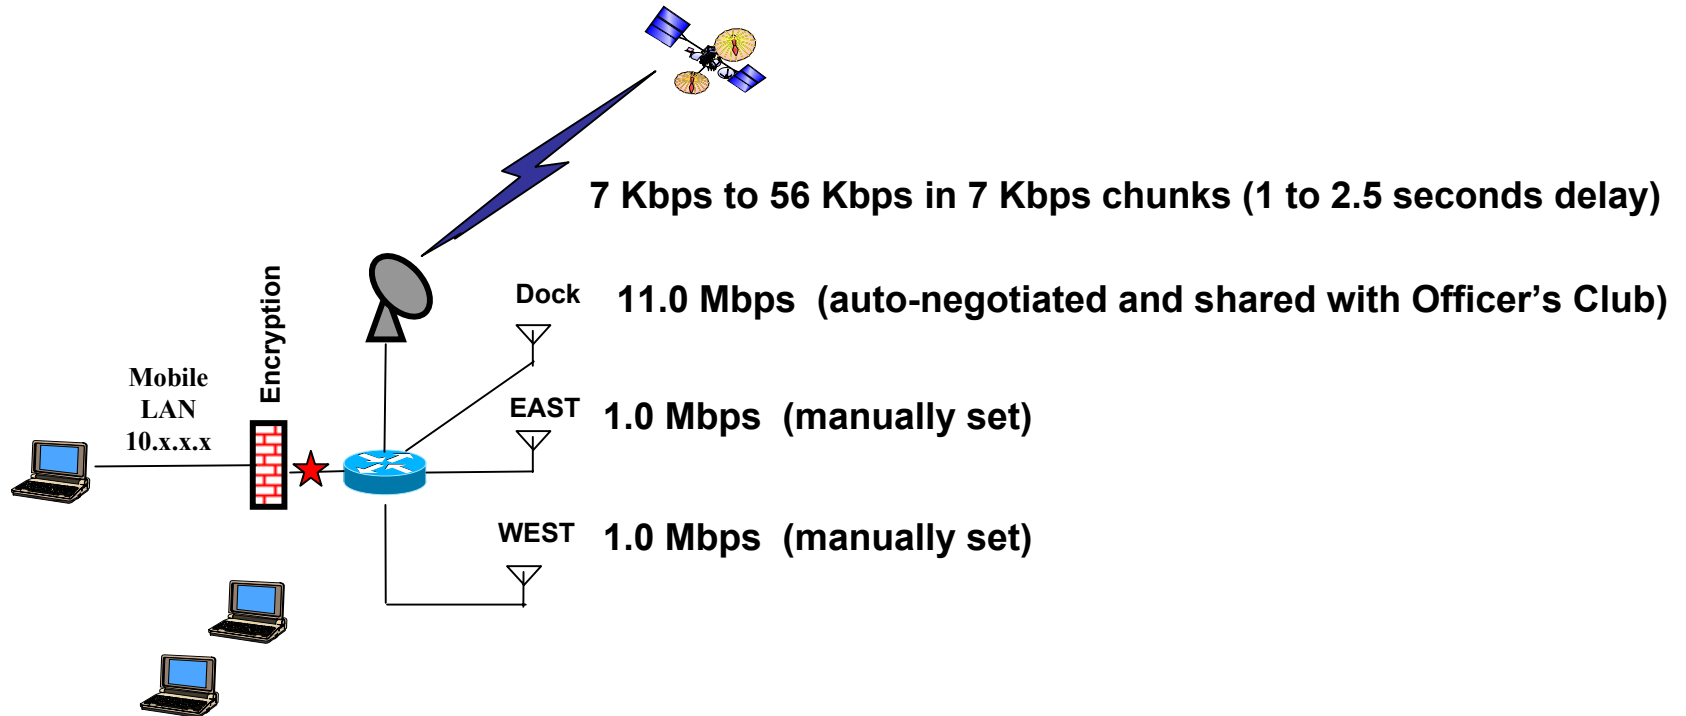

**Note, We are monitoring  
The Neah Bay.  
We are using lots of bandwidth  
To do this.**

**Note, We are monitoring  
The Neah Bay.  
We are using lots of bandwidth  
To do this.**

# RF Bandwidth

# Wireless Only?

---

- Wireless can be jammed
  - Particularly unlicensed spectrum such as 802.11
  - Satellites is a bit harder
  - Solution is to find interferer and make them stop.
- You still want land line connections
  - Mobile Routing can be used over land lines.

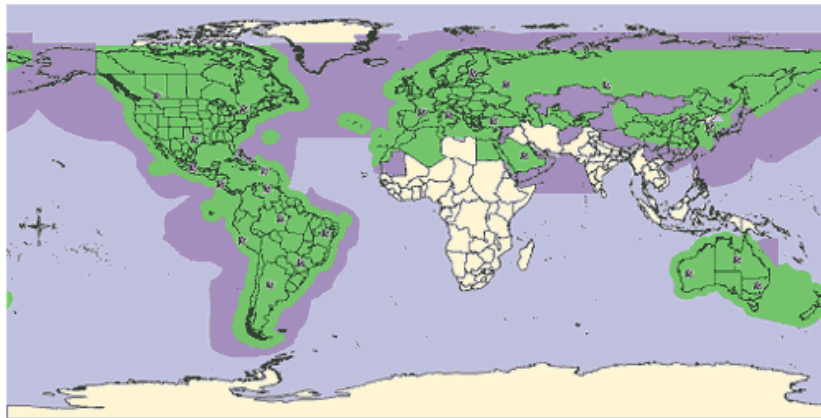

# Globalstar/Sea Tel MCM-8

---

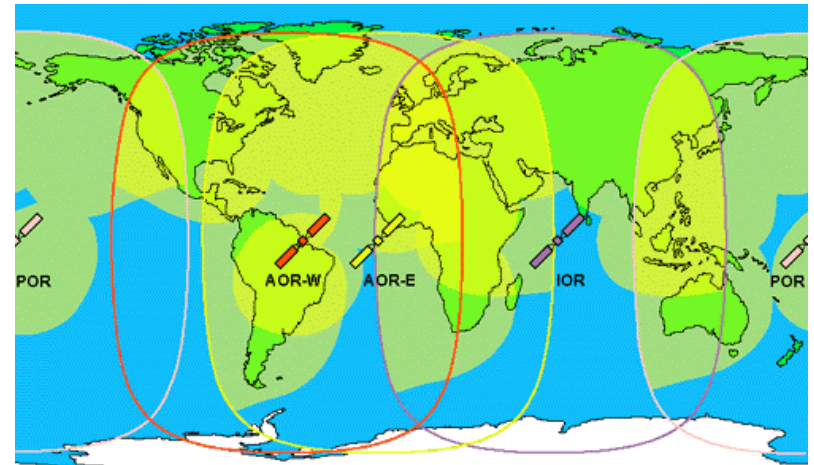

- Initial market addresses maritime and pleasure boaters.
- Client / Server architecture
  - Current implementation requires call to be initiated by client (ship).
  - Multiplexes eight channels to obtain 56 kbps total data throughput.
  - Full bandwidth-on-demand.
- Requires use of Collocated Care-of-Address

# Satellite Coverage

■ Globalstar Basic Coverage as of 1 April 2002  
■ Extended Service Coverage

# Securing Mobile and Wireless Networks

---

Some ways may be “better”  
than others!

# Constraints / Tools

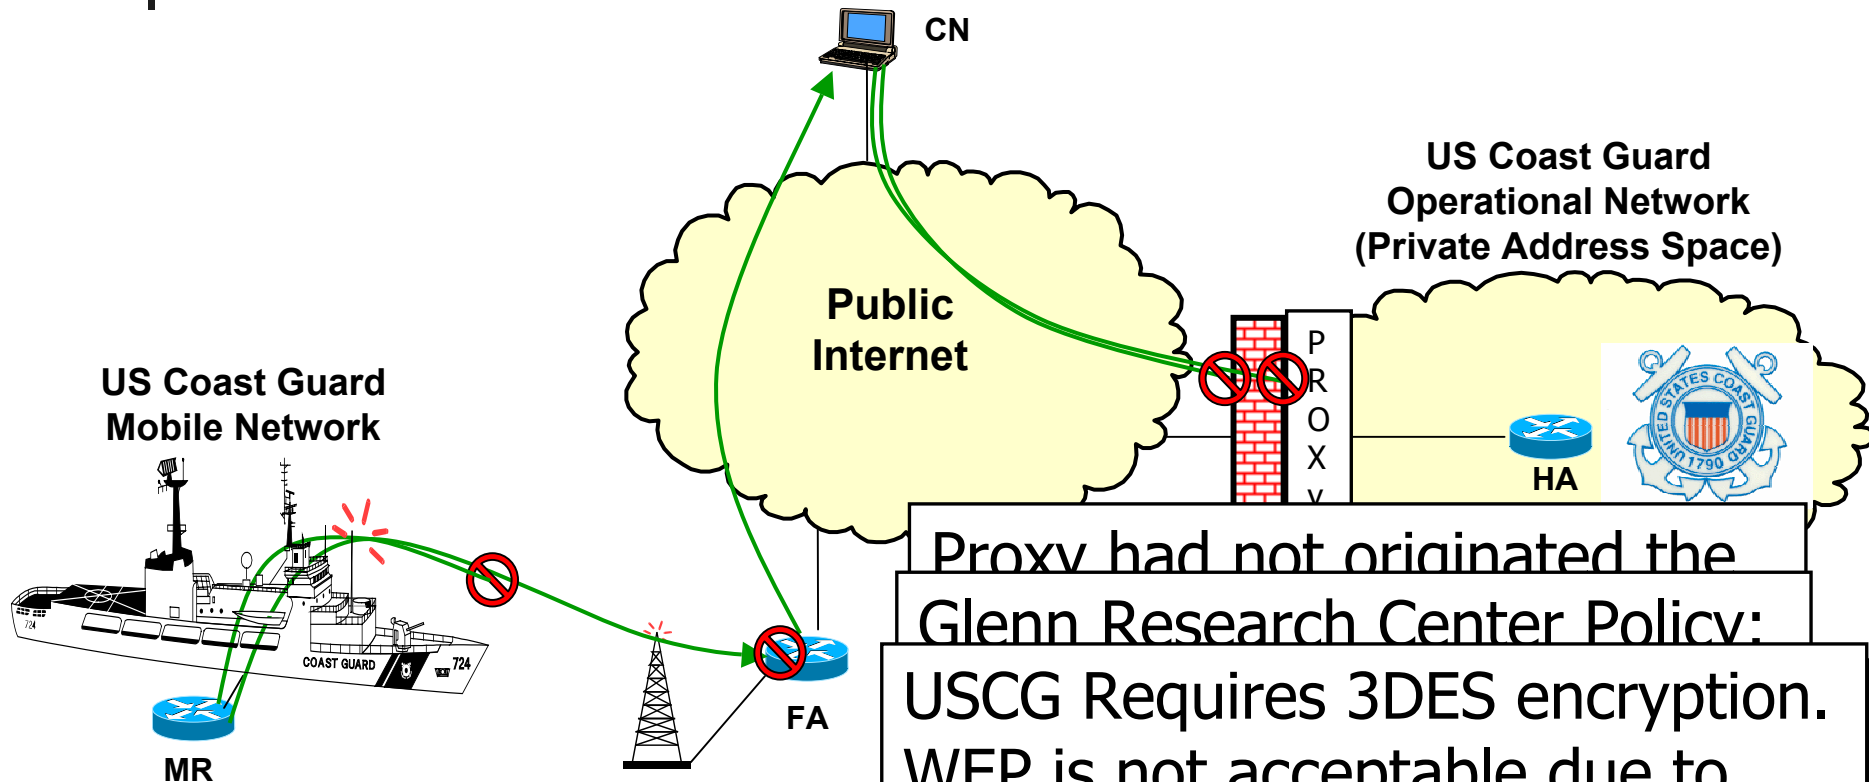

---

- Policy
- Architecture
- Protocols

# IPv4 Utopian Operation

# IPv4 "Real World" Operation

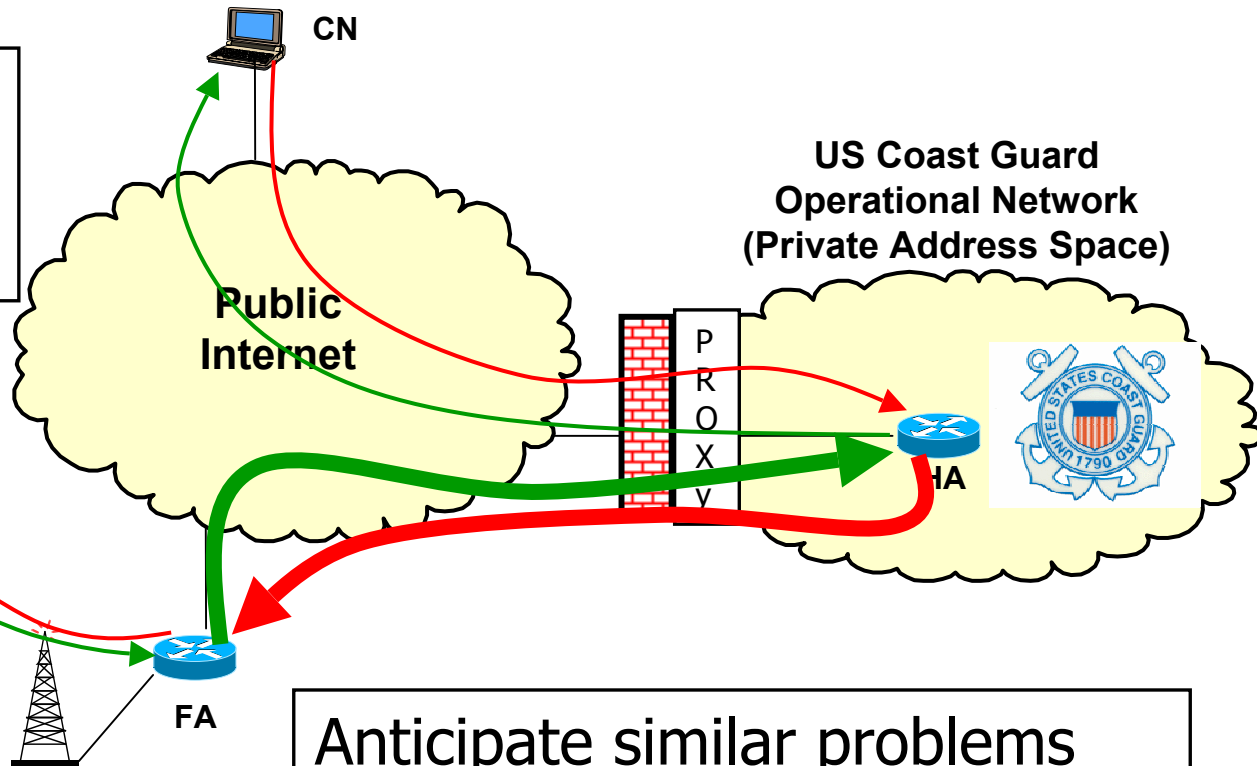

Proxy had not originated the  
Glenn Research Center Policy:  
USCG Requires 3DES encryption.  
WEP is not acceptable due to  
known deficiencies.

Corrects this problem.

# Current Solution – Reverse Tunneling

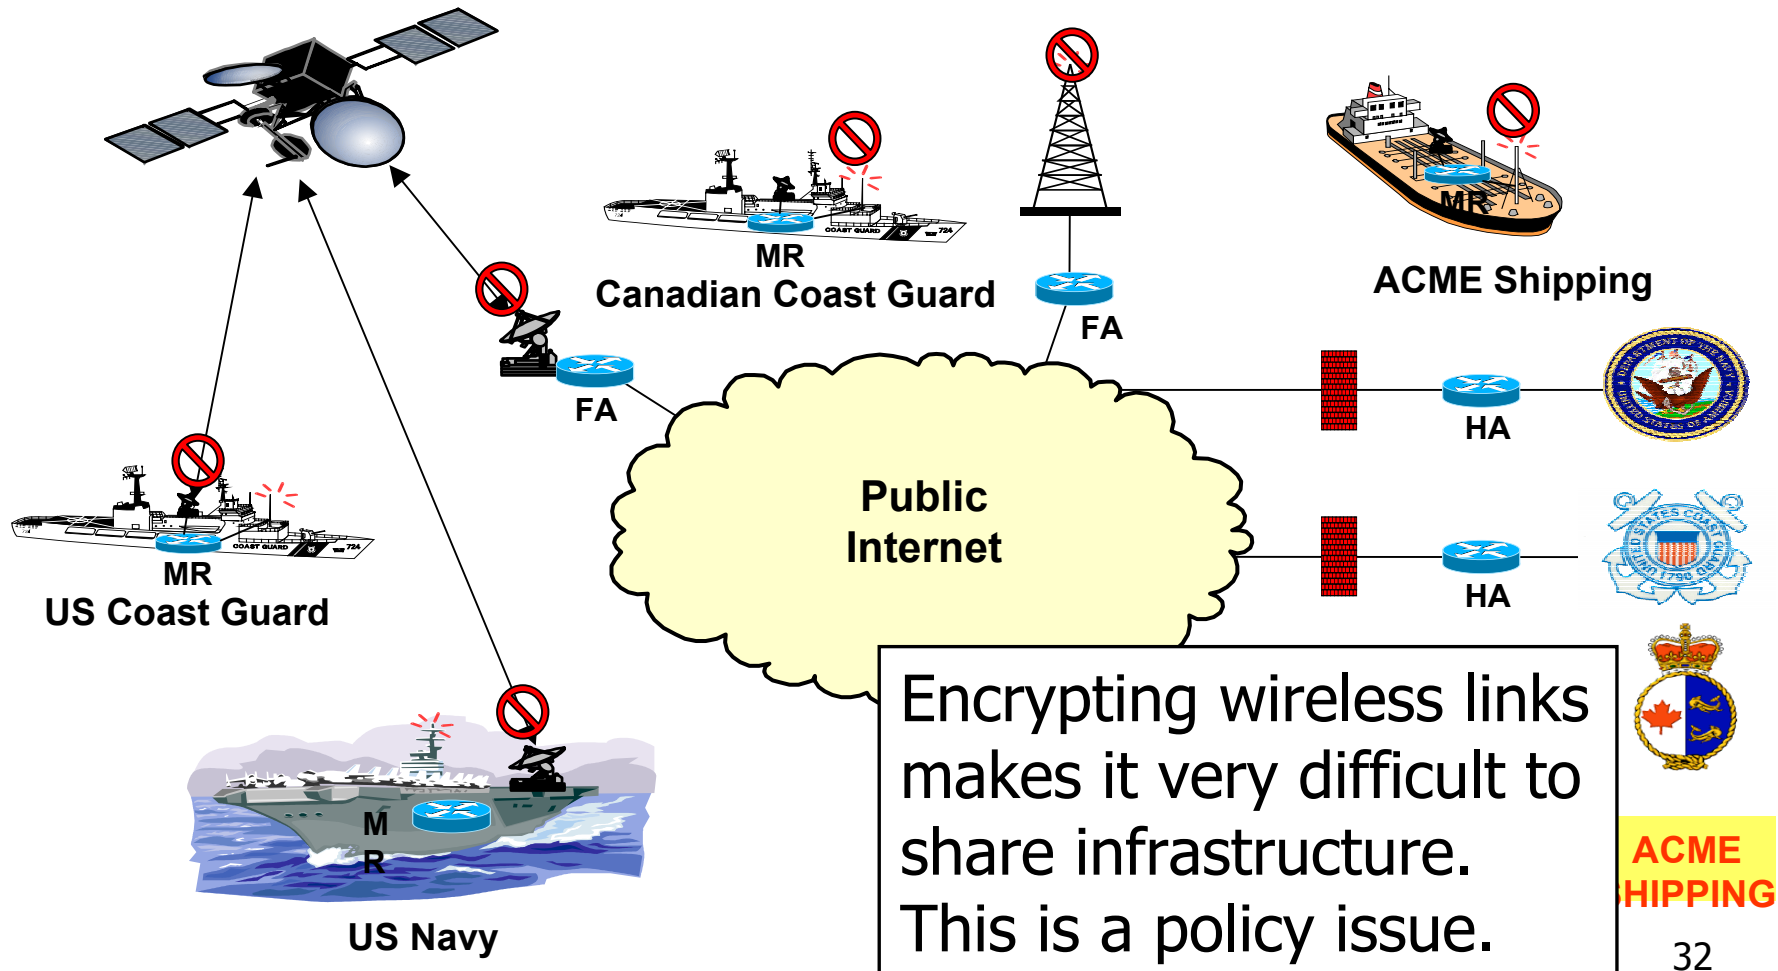

Adds Overhead and kills route optimization.

US Coast Guard Mobile Network

Anticipate similar problems for IPv6.

# Shared Network Infrastructure

# Security

- Security ↑      Bandwidth Utilization ↓
- Security ↑      Performance ↓
- Tunnels Tunnels Tunnels and more Tunnels
- Performance ↓      Security ↓  
⇒ User turns OFF Security to make system usable!
- Thus, we need more bandwidth to ensure security.

# Additional and Future Security Solutions

---

- AAA
  - Routers (available today)
  - Wireless bridges and access points (available 2002)
- IPSec on router interface
- Encrypted radio links
  - IPSec, type1 or type2, and future improved WEP

# Conclusions

---

- Security Breaks Everything ☹
  - At least it sometimes feels like that.
- Need to change policy where appropriate.
- Need to develop good architectures that consider how the wireless systems and protocols operate.
- Possible solutions that should be investigated:
  - Dynamic, Protocol aware firewalls and proxies.
    - Possibly incorporated with Authentication and Authorization.

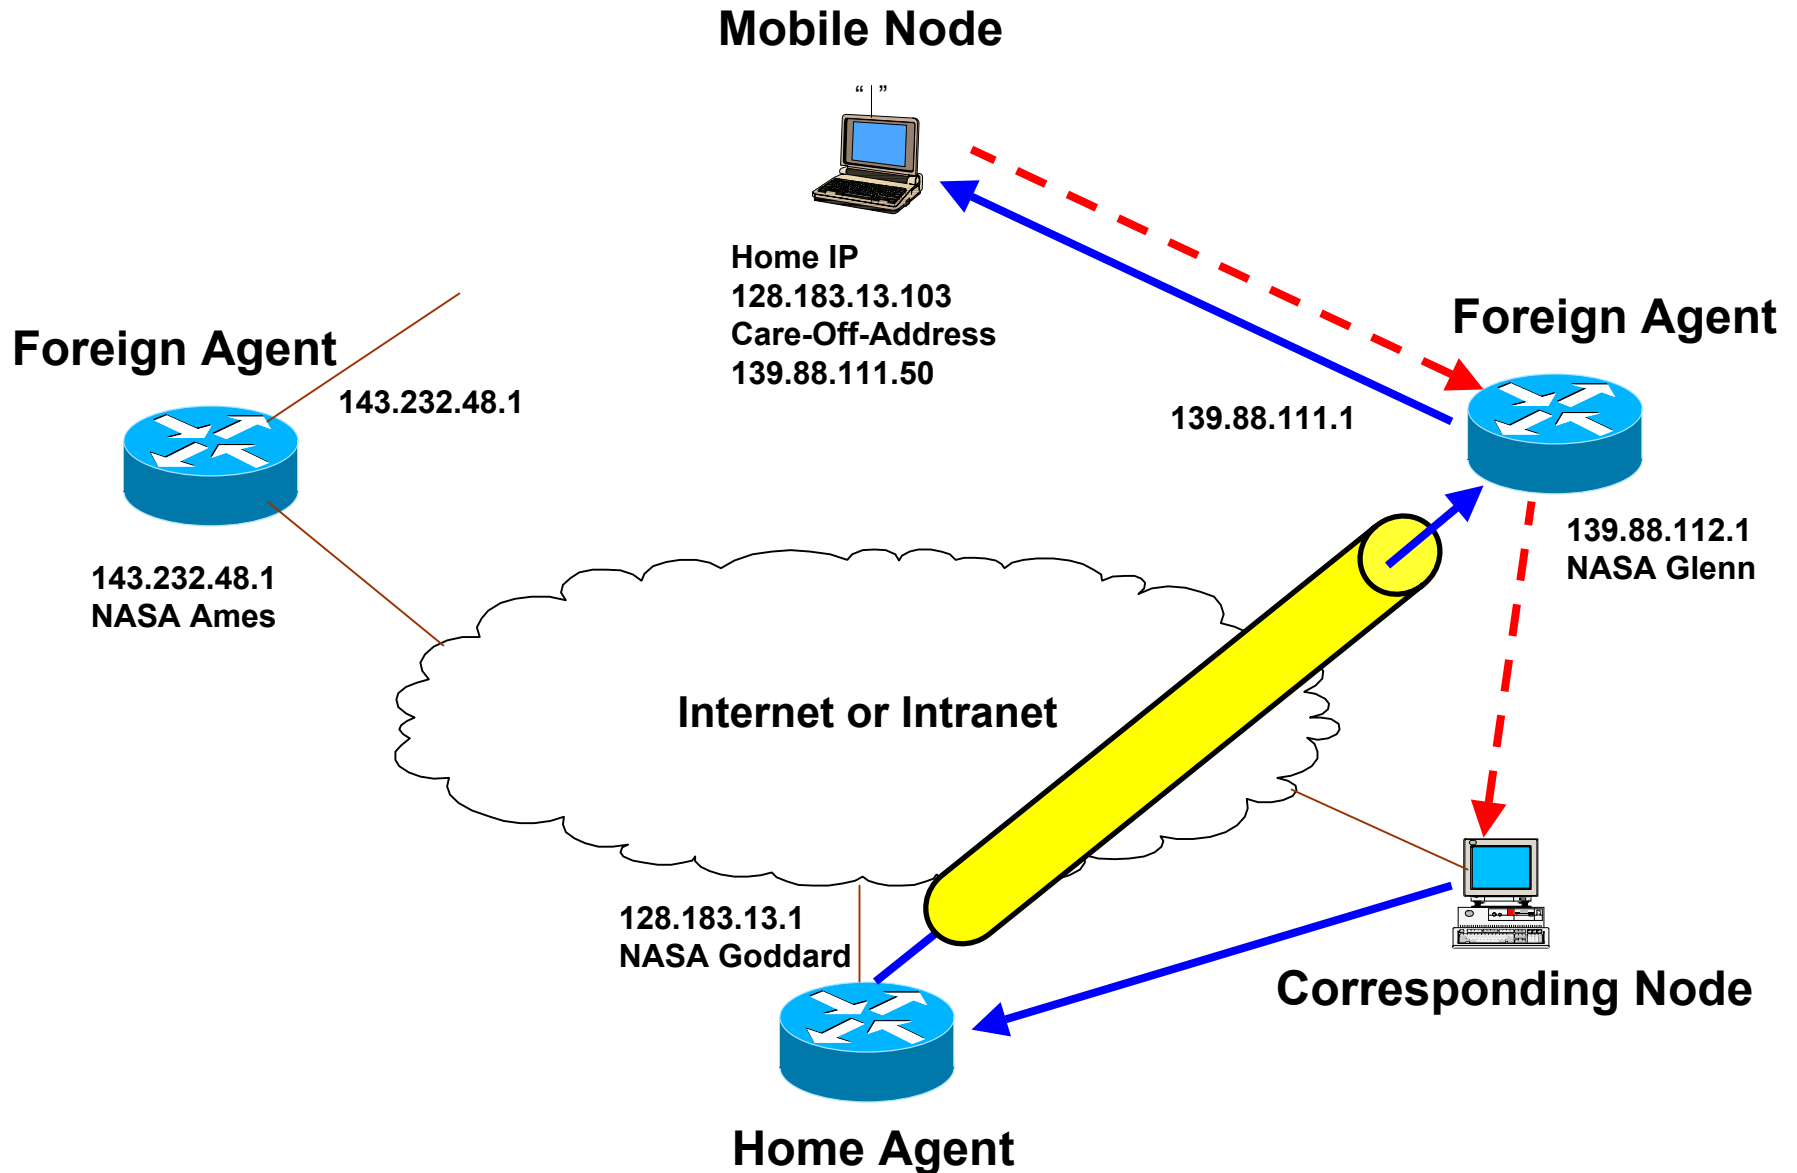

# Mobile-IP Operation

---

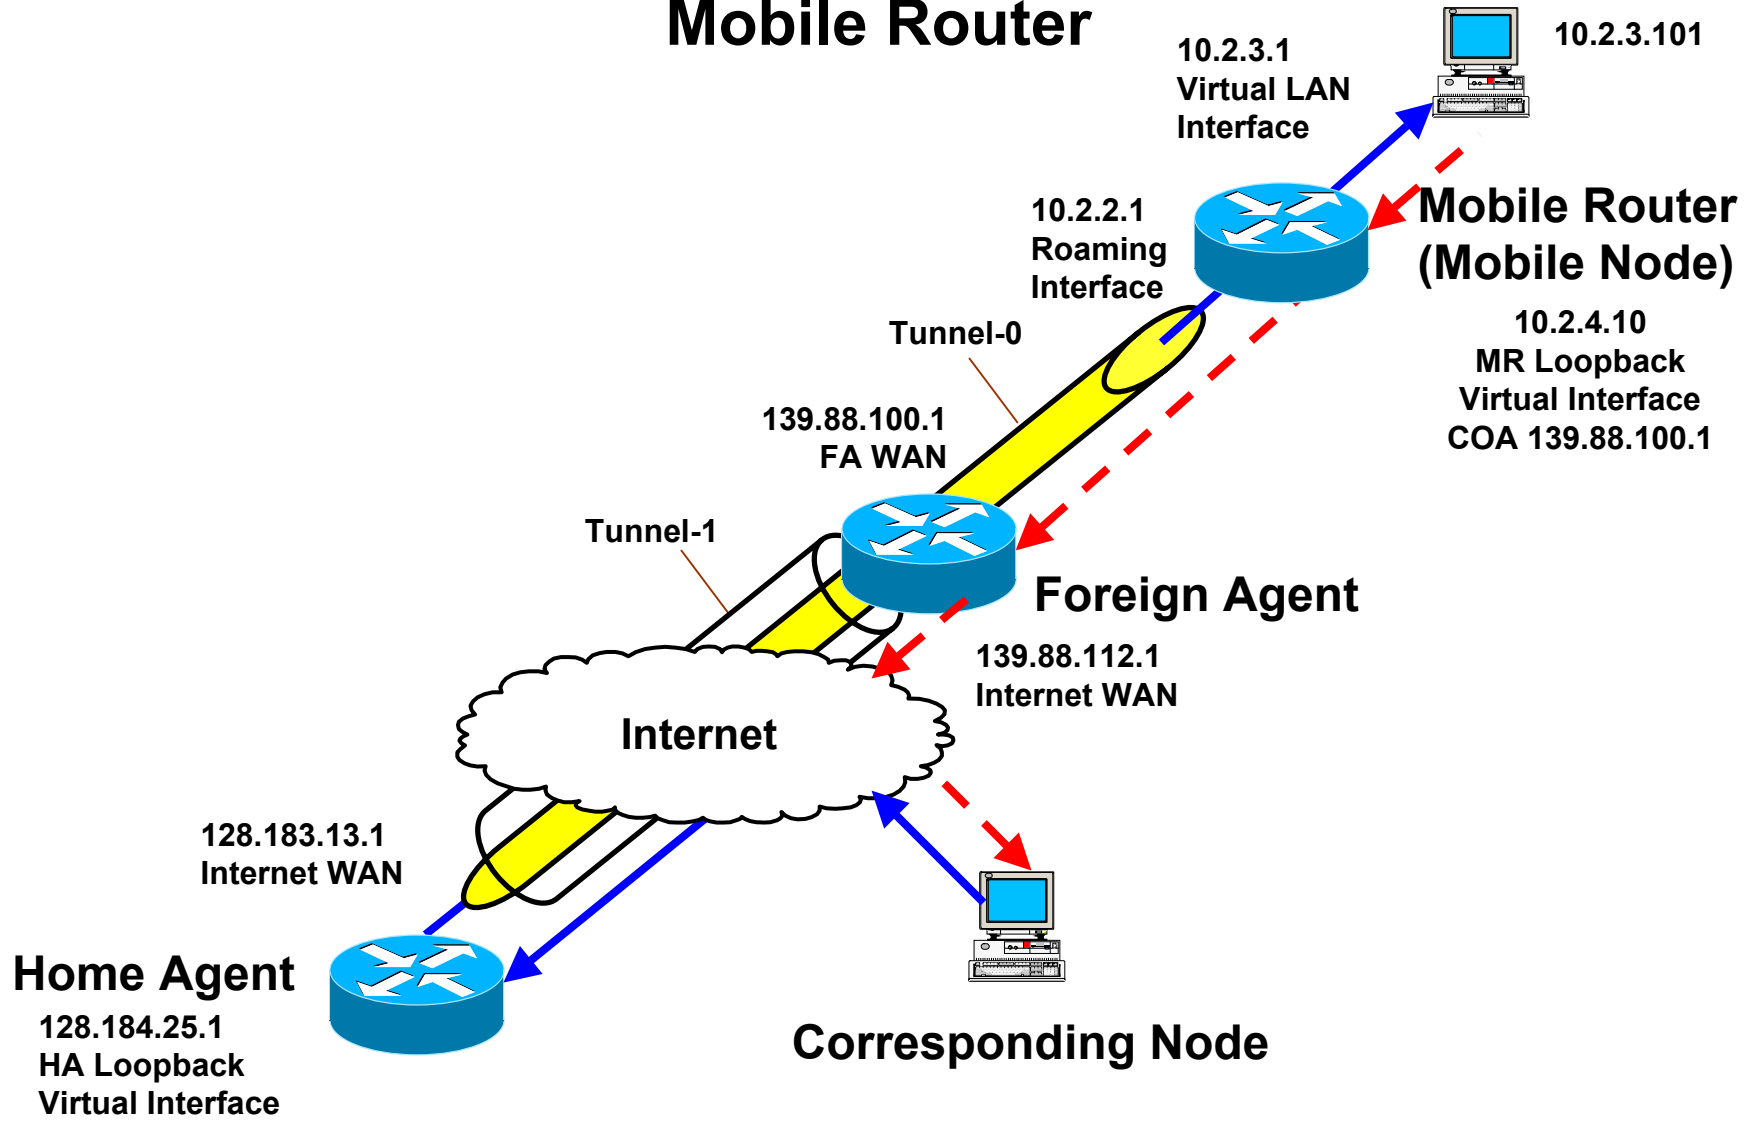

IPv4

# Mobile-IP (IPv4)

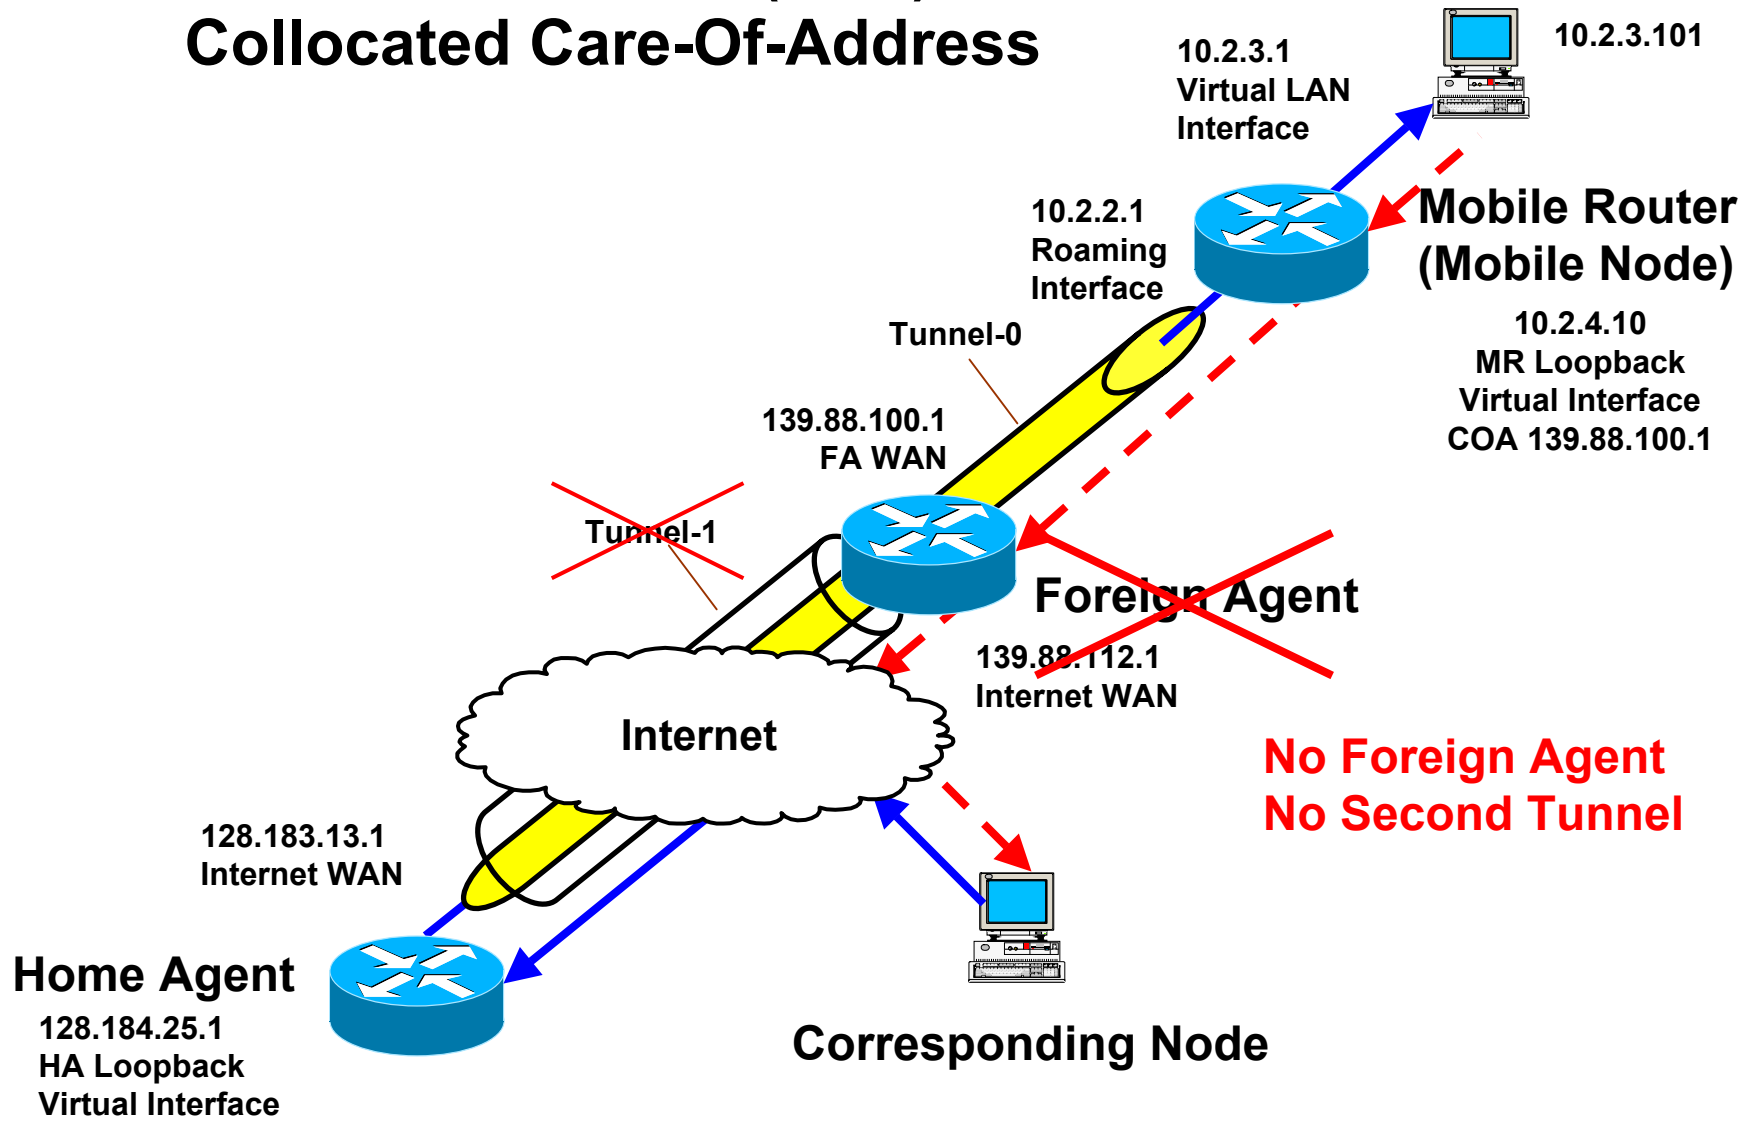

# Mobile-Router (IPv4)

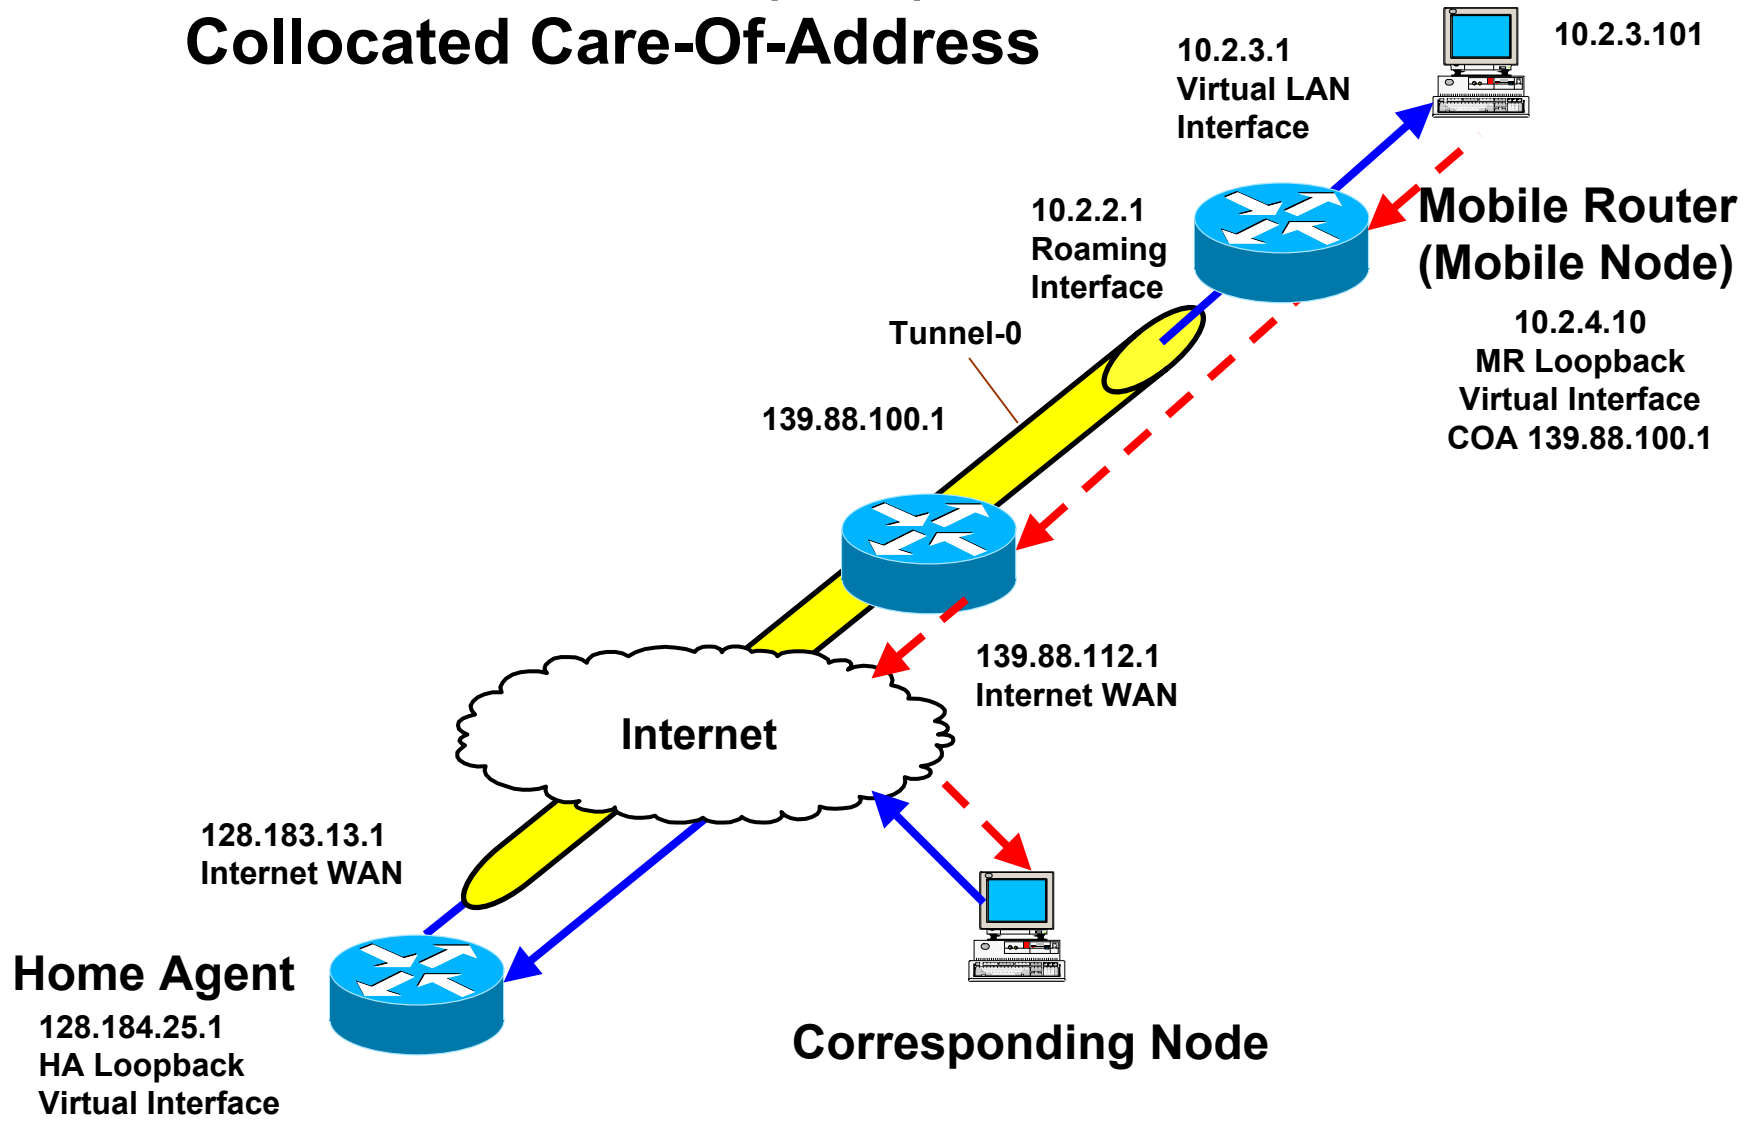

## Mobile Router

# Mobile-Router (IPv4) Collocated Care-Of-Address

# Mobile-Router (IPv4) Collocated Care-Of-Address

# What's Next

---

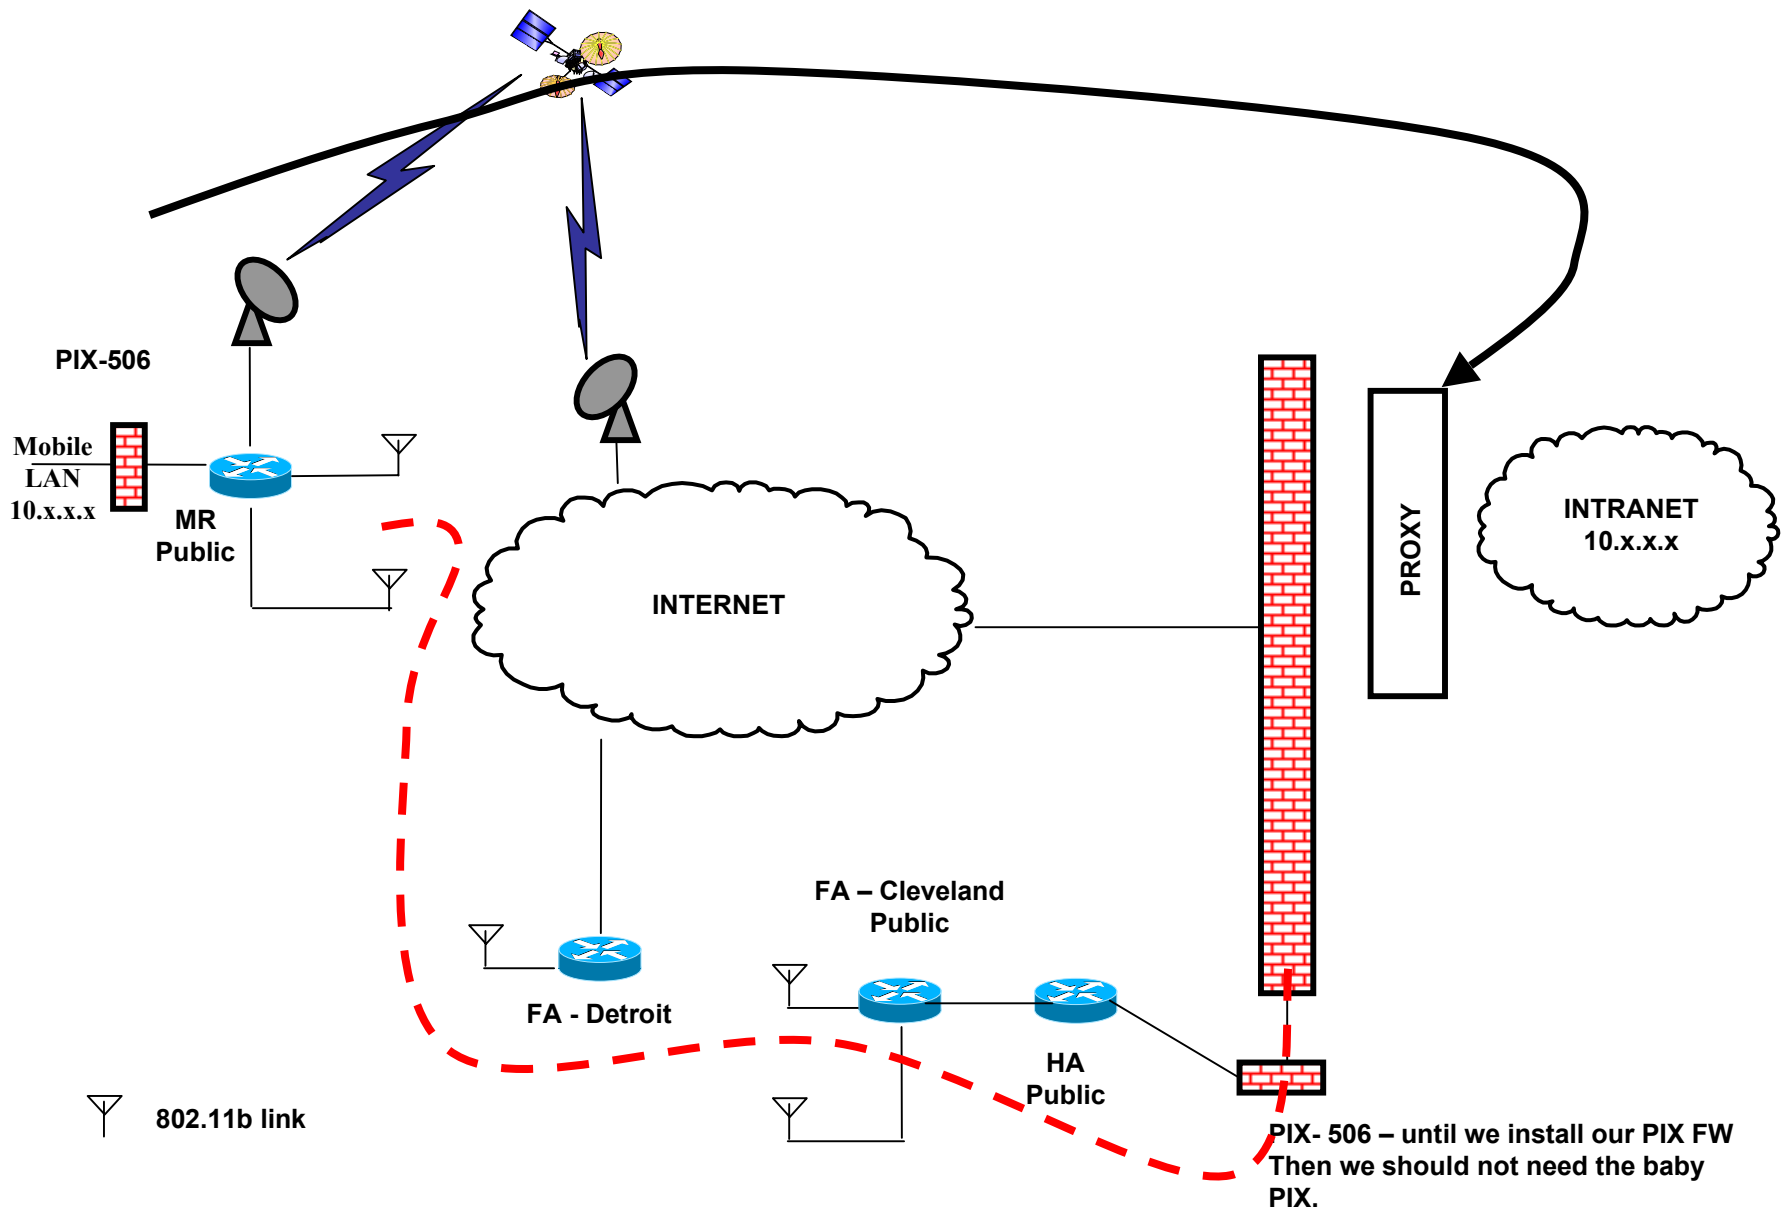

The End Game

# Mobile Networks

---

- Share Network Infrastructure
  - USCG, Canadian Coast Guard, Commercial Shipping, Pleasure Boaters
  - Open Radio Access / Restricted Network Access
    - Authentication, Authorization and Accounting
- Architecture
  - Limited, experimental deployment onboard Neah Bay
    - Move RIPv2 routing from Fed. Bldg to Neah Bay
  - Move to full scale deployment
    - Requires full commitment

# HA Outside Main Firewall

---

- Firewall between MR interfaces and public Internet as well as the HA and Private Intranet.
- Reverse tunneling required as requests from MR LAN hosts must pass through Proxy inside main firewall.

# Areas that need to be addressed

---

- Home Agent Placement
  - Inside or Outside the Firewall
- AAA Issues
  - Open Radio Access / Restricted Network Access
  - Secure Key Management
- IPv6 Mobile Networking Development
  - Work with industry and IETF
- Develop radio link technology
  - Enable better connectivity throughout the world for both military and aeronautical communications (voice, video and data).

# NASA's Needs

---

## Mobile Networks

# Relevant NASA Aeronautics Programs

---

- Advanced Air Transportation Technology (AATT)
- Weather Information Communication (WINCOMM)
- Small Aircraft Transportation System (SATS)

# Aeronautic Networking Issues

---

- Move to IPv6
  - IPv6 Mobile Networking
- Authentication, Authorization and Accounting
- Bandwidth, Bandwidth, Bandwidth
- Media Access
- Policy
  - Sending of Operations over Entertainment Channels

# Earth Observation

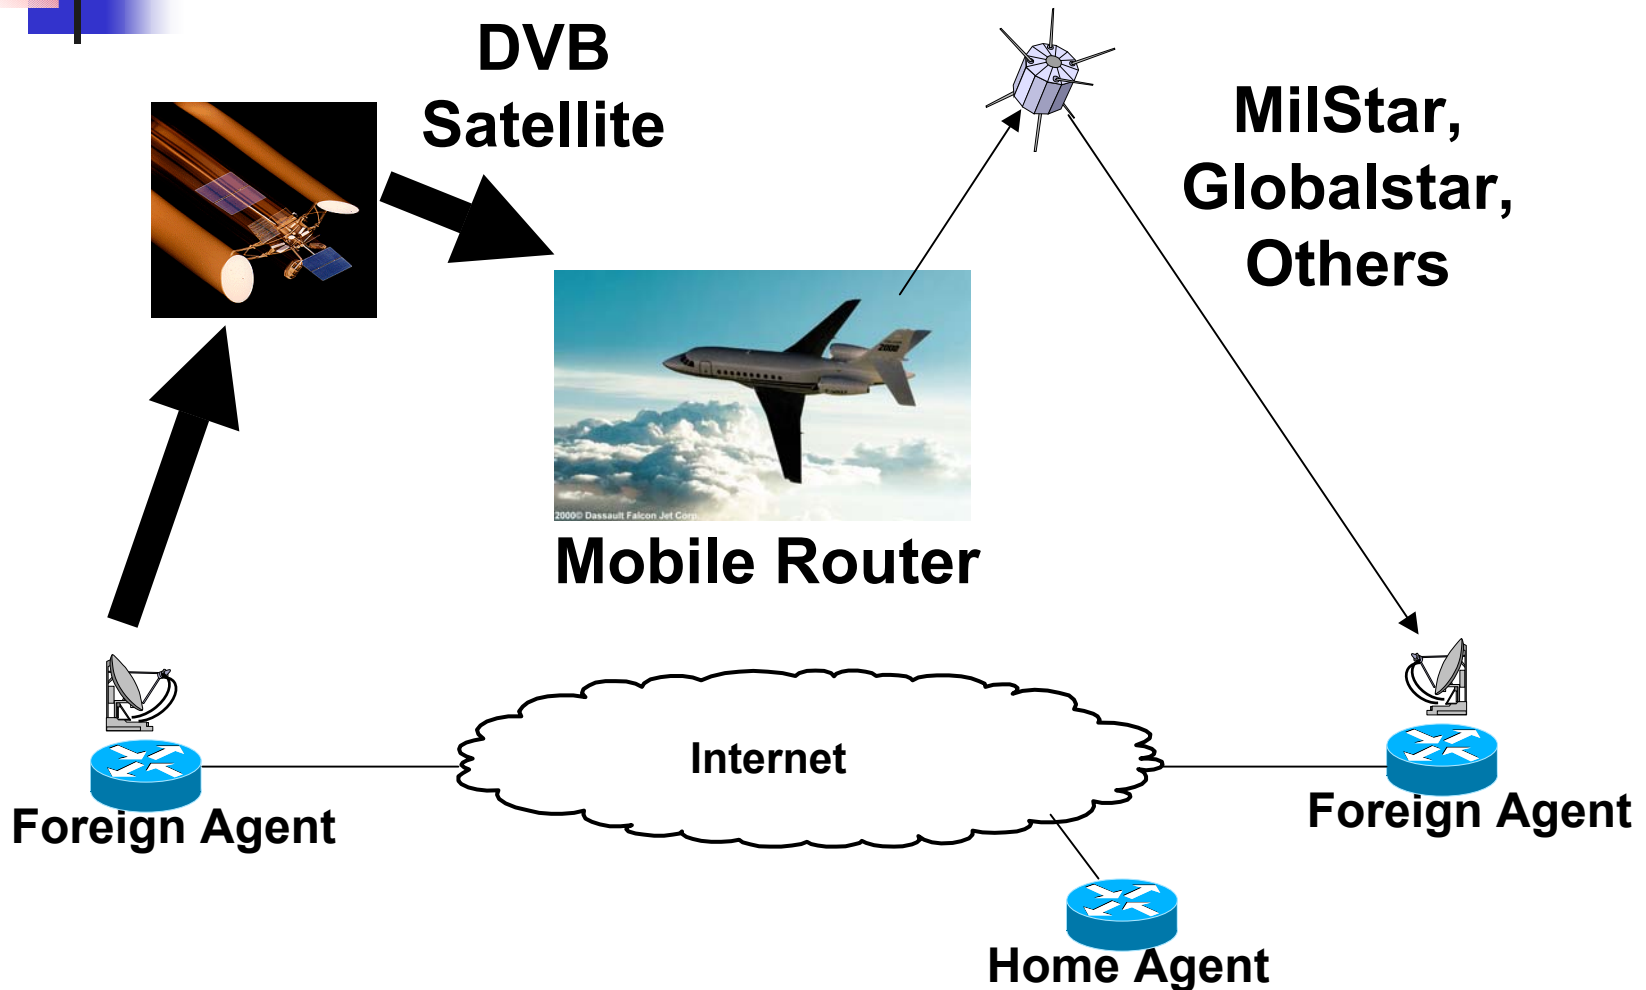

# Space Flight Implementation

---

- Sharing Infrastructure
  - Common Media Access
  - Common Ground Terminal Capabilites
  - Common Network Access
    - AAA
  - Common Modulation and Coding
    - Software Radio

# Backup

# Asymmetrical Pathing

# Neah Bay
